

Wooden Pinback Buttons

We manufacture wooden pinback buttons from birch plywood from FSC®-certified sources. The printed area is 5mm smaller than the final product diameter. There is always a 2,5mm clear space from the edge to the print.

The printing is always full-color CMYK with additional white color. This white base layer underneath the CMYK color ensures perfect color matching. Remember, using white as part of the design is also possible. In that case, supply an artwork that has, in addition to CMYK, a single Pantone® color (any color other than white) and ask for that to be replaced in white during printing.

Printing without a white base layer is also an option. As a result, the print is slightly translucent, and the wood's natural color is visible through the print. With this implementation, the wooden pinback buttons look more natural.

When using the wooden pinback buttons for identification, we recommend a small batch of blanks to be included in the order. In that case, you have something for last-minute visitors that can be written with a marker. For clarity, we recommend printing an area with a white background where the attendees' names are added.

We take no responsibility for incorrectly delivered printing material. Please always send your artwork in CMYK colors as a vector PDF file. **Never send a print file with attendees' names;** we cannot use files with custom layouts during printing. Send a separate Excel file with attendees and a sample file with placeholders.
